```
    Statistical Data Analysis Problem sheet 3

     1. Exercise 1
 [37] 1 #importing all the libraries
        2 import pandas as pd
        3 import numpy as np
 [38] 1 #getting the X values as a dataframe
        2 dfx = pd.read_csv('/content/drive/MyDrive/1-DS/X.txt', sep=",", header=None)
  [39] 1 #getting the Y values as a dataframe
        2 dfy = pd.read_csv('/content/drive/MyDrive/1-DS/Y.txt', header= None)
  Now we need to convert them into matrix
        2 x = dfx.to_numpy()
        3 y = dfy.to_numpy()
  [41] 1 #adding an identity column to the x to equalize the full rank p + 1
        2 x = np.insert(x, 0, 1.0, axis=1)
  As the LS estimator is equivalent to the ML estimator based on the maximization of the log likelihood, we can estimate the beta hat from it.
  [42] 1 #beta hat estimating
        2 xt = np.transpose(x)
        3 xtx = xt.dot(x)
        5 beta = np.linalg.inv(xtx).dot(xt).dot(y)
        6 beta
```

```
1 #now we can get the sigma hat square in the multiple linear regression model
       2 sgms = (np.transpose(y-x.dot(beta))*(y-x.dot(beta))) / 201
       3 sgms
     array([[ 1.43756944e-04, -2.60179376e-04, 4.88288715e-05, ...,
